The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coli, enable the cloning of certain genes of Ketogulonigenium in E.coli as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the shuttle vector plasmid pADM291-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid vector comprising Ketogulonigenium replicon found a specific deposited endogenous plasmid, useful for producing polypeptides and/or transcripts by culturing host cells transformed with vector .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

Expression of the latter is under control of a lactose gene, phage T7 and tryptophan promoters and the terminator of translation rrn B-T1T2, containing a gene determining resistance to kanamycin and containing a DNA fragment from plasmid pUC19 that is responsible for replication of recombinant plasmid. The cells can be used in biotechnology, molecular biology and genetic engineering. The invention can be used for preparing recombinant human leukocyte alpha-2b interferon for medicinal use. The present requesce is an oligonucleotide described in the exemplification of the

The present invention relates to a pharmaceutical DNA vaccine compositic comprising an expression vector and a DNA molecule containing a codon optimised open reading frame encoding HIV-1 Pol protein or its inactivated form. HIV-1 Pol protein or its inactivated form the protein or its inactivated form generates a cellular immune response against human immunodeficiency virus-1 (HIV-1) infection. The DNA vaccine is useful for inducing an immune response against infections or diseases caused by virulent strains of HIV in a payalist infection of diseases caused by virulent strains of HIV in a human. The protein encoded by the DNA vaccine is useful as a protein-based HIV vaccine. The present sequence is a vaccine vector VIJ based in the preparation of DNA vaccine. VIJ comprises human cytomegalovirus (CMV)intA promoter, bovine growth hormone (BGH) transcription termination elements, SfiI restriction sites adm kanamycin and ampicillin resistance genes.
                                                                                                                                                                                                                                                                                                                                                                                                                          Polynucleotide vaccine composition for immunization against human immunodeficiency virus infection or to combat existing HIV conditions DNA molecule containing codon optimized HIV-1 Pol or modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Shiver JW,

The present invention relates to a DNA vaccine comprising a DNA CC expression vector, and a DNA molecule containing a codon optimised open CC reading frame encoding a wef protein or its immunogenic derivative. The CC Nef protein or its derivative is expressed and generates an immune CC infection, upon administration of to a host. The DNA vaccine is useful CC response which provides a substantial level of protection against HIV CC for inducing a cell mediated immune (cytotoxic Tlymphocyte, CTL) CC by administering the DNA vaccine into the tissue of the vertebrate host, CC preferably human. It is also useful for lowering transmission rate to CC preferably human. It is also useful for lowering transmission rate to CC codes within an infected individuals and/or for reducing levels of viral CC phase of HIV infection. The present sequence is a vaccine vector cCC vlns with Sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with Sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with Sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus intron A promoter, CCC vlns with sfil site comprises human cytomegalovirus

HIV-1 Pol protein or its inactivated form generates a cellular immune response against human immunodeficiency virus-1 (HIV-1) infection. The DNA vaccine is useful for inducing an immune response against infections or diseases caused by virulent strains of HIV in a human. The protein encoded by the DNA vaccine is useful as a protein-based HIV vaccine. The present sequence is a vaccine vector vibus-tpA to construct human tissue-specific plasminogen activator (tPA) and HIV-1 pol DNA fusion construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chimeric

                                                                                                                                                                                                                                       The present invention relates to a DNA vaccine comprising a DNA expression vector, and a DNA molecule containing a codon optimised open creading frame encoding a Nef protein or its immunogenic derivative. The Nef protein or its derivative is expressed and generates an immune response which provides a substantial level of protection against HIV infection, upon administration of to a host. The DNA vaccine is useful for inducing a cell mediated immune (cytotoxic T lymphocyte, CTL) response against infection or disease caused by virulent strains of HIV, by administering the DNA vaccine into the tissue of the vertebrate host, preferably human. It is also useful for lowering transmission rate to previously uninfected individuals and/or for reducing levels of viral loads within an infected individual, so as to prolong the asymptomatic phase of HIV infection. The present sequence is a vaccine vector VlJns-tPA to construct human tissue-specific plasminogen activator (tPA) and HIV-1 pol DNA fusion construct.

                                                                                                                                                                                                                                                                             The variant GHRH polypeptides can be administered to animals to treat growth hormone deficiency related disorders, or to improve growth and/or performance. The variants can be included in pharmaceutical compositions to promote expression and elevation of growth hormone. The variants can be produced recombinantly at much higher levels than prior art variants modified using traditional chemical methods. They have enhanced resistance to enzymatic degradation, therefore have increased length of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4859

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to growth hormone-releasing hormone (GHRH) variants having enhanced resistance to enzymatic degradation. The variant GHRH polypeptides can be administered to animals to treat growth hormone deficiency related disorders, or to improve growth and/or performance. The variants can be included in pharmaceutical compositions to promote expression and elevation of growth hormone. The variants can be produced recombinantly at much higher levels than prior art variants modified using traditional chemical methods. They have enhanced resistance to enzymatic degradation, therefore have increased length of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GHRH; growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Plasmid GHRH1-29YWTCMV

                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to growth hormone-releasing hormone (GHRH) variants having enhanced resistance to enzymatic degradation. The variant GHRH polypeptides can be administered to animals to treat growth hormone deficiency related disorders, or to improve growth and/or performance. The variants can be included in pharmaceutical compositions to promote expression and elevation of growth hormone. The variants can be produced recombinantly at much higher levels than prior art variants modified using traditional chemical methods. They have enhanced resistance to enzymatic degradation, therefore have increased length of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 growth hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide variants of growth hormone releasing enhanced resistance to enzymatic degradation, useful growth hormone deficiency related disorders or to imp

                                                                                                                                                                                                                                                                                                                                                             (GHRH) variants having enhanced resistance to enzymatic degradation. The variant GHRH polypeptides can be administered to animals to treat growth hormone deficiency related disorders, or to improve growth and/or performance. The variants can be included in pharmaceutical compositions to promote expression and elevation of growth hormone. The variants can be produced recombinantly at much higher levels than prior art variants modified using traditional chemical methods. They have enhanced resistance to enzymatic degradation, therefore have increased length of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2954

                                                                                                                                                                                                              The present invention relates to growth hormone-releasing hormone (GHRH) variants having enhanced resistance to enzymatic degradation. The variant GHRH polypeptides can be administered to animals to treat growth hormone deficiency related disorders, or to improve growth and/or performance. The variants can be included in pharmaceutical compositions to promote expression and elevation of growth hormone. The variants can be produced recombinantly at much higher levels than prior art variants modified using traditional chemical methods. They have enhanced resistance to enzymatic degradation, therefore have increased length of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GHRH; growth hormone-releasing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plasmid GHRH1-44YWTCMV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to growth hormone-releasing hormone (GHRH) variants having enhanced resistance to enzymatic degradation. The variant GHRH polypeptides can be administered to animals to treat growth hormone deficiency related disorders, or to improve growth and/or performance. The variants can be included in pharmaceutical compositions to promote expression and elevation of growth hormone. The variants can be produced recombinantly at much higher levels than prior art variants modified using traditional chemical methods. They have enhanced resistance to enzymatic degradation, therefore have increased length of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide variants of growth hormone releasing hormone with enhanced resistance to enzymatic degradation, useful for treating growth hormone deficiency related disorders or to improve growth performance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plasmid pGHRH1-44WTGHpep

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           В
                                          which contains the cytomegalovirus immediate-early gene promoter, cenhancer, and 5' untranslated sequences followed by a multiple cloning site for inserting genes to be expressed. The transcriptional terminator region includes the polyA and termination signals from the rabbit beta-globin gene. VR1051 is used as a DNA mass control for VR6200 (see AAF30313), which expresses a secreted form (see AAB20187) of mouse Fms-like tyrosine kinase (Flt-3 ligand). The invention is directed to chancing the immune response of a vertebrate to an antigen or a cytokine by administering in vivo a Flt-3 ligand-encoding polynucleotide such as VR6200, and 1 or more antigen- or cytokine-encoding polynucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2954
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunogenic compositions comprising Flt-3 ligand encoding polynucleotide and one or more antigen, or cytokine encodipolynucleotides, useful for suppressing tumour growth and autoimmune diseases (e.g. rheumatoid arthritis)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chimeric -

                                                                                                                                                                                                                                                CC The present invention relates to a method for determining the amount CC of fusion that occurs between two cells, one of which contains the CC enzyme beta-lactamase and the other of which contains a fluorescent CC substrate of beta-lactamase. The method comprises the measurement of CC fluorescence resonance energy transfer (FRCT). The invention also CC provides methods of identifying inhibitors of the fusion of two CC types of cells, particularly when fusion is mediated by the CC interaction of a viral protein and target cellular proteins e.g. CD4 CC and cytokine receptors. The methods are useful for identifying CC substances that are useful for the treatment of viral diseases, CC particularly for the identification of inhibitors of HIV-1 infection. The present DNA sequence for expression vector pVlJneo is used in the CC methods of the present invention.

                                                                                                                                                                                                                                                                                                                                                                        07-MAR-1994;
                                                                                                                                                                                 Vector VlJneo (AAT01114) was obtd. from vector VlJ (AAT01113) by replacement of the ampicillin-resistance gene with a neomycin-resistance gene. The vector also contains a CMVintA-GBH terminator construct (AAT01112) providing controlled expression of heterologous genes. Insertion of HIV antigen genes into the vector allows large-scale production of polynucleotide vaccine in bacterial host

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seq length: 0 seq length: 2000000000

APPLICANT: HUEBNER, Robert C.
APPLICANT: LIANG, Xiaowu
APPLICANT: LIANG, Xiaowu
APPLICANT: CANNER, KIStin R.
APPLICANT: BARBOUR, Alan G.
APPLICANT: LUKE, Catherine JO.
TITLE OF INVENTION: COMPOSITIONS AND METHODS
TITLE OF INVENTION: ADMINISTERING BORRELIA DN
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSE: Curtis, Morris & Safford, P.C.
STREET: 530 Fifth Avenue
CITY: New York
STATE: NY
COUNTRY: USA
ZIP: 10036
COMPUTER READABLE FORM:
MEDJUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version
CURRENT APPLICATION NUMBER: US/08/663,998
FILLING DATE: 06-JUN-1996
CLASSIFICATION NUMBER: US/08/663,998
FILLING DATE: 06-JUN-1996
CLASSIFICATION NUMBER: 32,117
REGISTRATION NUMBER: 33,117
REGISTRATION NUMBER: 454312-2440
TELEPHONE: 212-840-3333
INFORMATION FOR SEQ ID NO: 2:
SEQUENCE CHARACTERISTICS:
LENGTH: 5952 base pairs
TYPE: nucleic acid
TYPE: DUCLEIC acid
STRANDEDNESS: Single
TOPOLOGY: linear
MOLECULE TYPE: DNA (genomic)
